Dianabol

Dianabol (also known as Dbol, Methandrosteneolone, and methandienone) is one of the most popular anabolic steroids and performance enhancing drugs. This steroid is a very anabolic and androgenic drug that provides little progestational activity. The chemical name of Dianabol is [17a-methyl-17b-hydroxy-1,4-androstadien-3-one] and its molecular formula is C20H28O2. It has an anabolic-androgenic ratio of 90-210:40-60 and can be detected over a period of six weeks. It has the molecular weight of 300.44 g/mol at the base.

Categorized as a Schedule III drug under the Anabolic Steroid Control Act of 1990, Dianabol is medically recommended to people suffering with osteoporosis and health complications requiring improved protein synthesis. The fact that 17?-methylation of the steroid helps it easily pass through the liver is one of the biggest reasons behind its popularity. Moreover, this steroid has the ability to minimize SHBG (sex hormone binding globulin), which deactivates steroids to prevent them from further reactions with the body. The drug is also suggested for treating health conditions like chronic adrenocortical insufficiency, thyrotoxicosis, interstitial-pituitary insufficiency, diabetic angiopathies (retinopathy and nephropathy), steroidal diabetes, and pituitary dwarfism. It can even be recommended during radiotherapy for laryngeal tumors.

The steroid has a profound effect on protein metabolism and promotes well being by facilitating positive nitrogen balance. Use of this steroid is also associated with improvement of mood, self-esteem, appetite, and self-confidence enhancements and normalizing effect on all functions of the body to promote physical and mental state and improving sleep patterns. In addition to that, the use of Dbol is linked to enhancements in terms of body calcium and potassium levels and offering assistance in the release of insulin besides transmission of sensor alerts. Dianabol is also admired by sportsmen as it its use for a period of six to eight weeks is related with glycogenolysis, nitrogen storage, protein synthesis, muscle mass, muscle function, and body strength gains that are nearly permanent. Dbol is commonly used by sportsmen to kick-start mass and strength gains at the start of a long bulking cycle. Since Dianabol has a short active life, multiple doses of it are required to be taken throughout the day.

The recommended dose of Dbol for men is 25-50 mg per day when taken orally and 50-150 mg per week when taken in an injectable form. The anabolic compound is generally stacked with testosterone enanthate, Nandrolone, Anadrol, Proviron, testosterone propionate, Trenbolone acetate, and testosterone cypionate and post cycle therapy with antiestrogens such as Clomid and Nolvadex is highly recommended to restore production of naturally-occurring testosterone and reduce or eliminate estrogenic side effects.

This anabolic steroid is not recommended to girls and women, especially those who may get pregnant while using the steroid or already pregnant or lactating. Its use is also not recommended to children or those struggling with hypertension, high blood pressure, and prostate or breast cancer. Dbol should also not be used by people having an existing allergy to its ingredients. Use of Dianabol is not recommended to those suffering from health problems like testicular atrophy, testicular cancer, prostate cancer, breast cancer, liver damage, kidney damage, stroke, high blood pressure, and respiratory problems.

Since Dbol can convert to estradiol via aromatase, estrogenic side effects may be a concern for users of this steroid. Some of the most common side effects of Dianabol include oily skin, acne, gynecomastia, water retention, and high blood pressure. In rare cases, nose bleeding may be a cause of concern while using methandrostenolone. In order to avoid these side effects of Dbol, it is best to use an estrogen blocker such as Nolvadex or an aromatase inhibitor such as Arimidex. Being a 17-alpha-alkylated compound, Dbol use can cause elevated liver values and therefore users of this anabolic steroid are advised to monitor liver function at regular
intervals. Since liver toxicity may become a problem for some Dbol users, it is best to have ready supplies of Tyler Liver Detox or Milk Thistle. Moreover, users of the steroid should consume 7-9 glasses of water and take other liquids such as fresh juices at regular intervals or if the need arises.

When over-dosed or abused, Dianabol use may cause side effects like increased aggression, male pattern baldness, clitoral hypertrophy, oily skin bouts, and insomnia and indiscriminate use of this steroid may lead to difficulty when urinating, edema (swelling), fever, or pain in the lower back (particularly in the kidney areas) and even high blood pressure and damage to kidneys. At no point of time, this anabolic steroid should be used in absence or contravention of medical advice. Moreover, use of Dbol should always be made for a legal purpose and as per medical directions. In case a dose of the steroid is missed, for any reason, the same should be ignored and the next dose should be taken as scheduled.

In case of expired Methandrostenolone tablets or if the tablets or injections are not to be used any more, the same should be discarded after having consulting a pharmacist or local waste disposal company on how to safely discard Methandrostenolone. It is highly recommended that Dbol should not be flushed down the toilet or poured into a drain, unless specifically recommended by a qualified authority. Methandienone tablets or injections should be properly discarded, when expired or no longer needed. Dianabol must be stored at a controlled room temperature of 20° to 25°C (68° to 77°F) with excursions permitted to 15° to 30°C (59° to 86°F) and kept away from unauthorized use, pets, sunlight, moisture, and children.

The anabolic steroid can be purchased online available with or without a medical prescription in different forms such as pills, creams, gels, injections, and capsules under names like Metandienone, Reforvit-b, Averbol, and Danabol. Last but not the least, anabolic steroids such as Dianabol are extremely potent drugs and should be used very carefully and must be purchased after medical advice and such purchase should always be made from a reputed drug store that deals in legal anabolic steroids and performance enhancing drugs.
